Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. Over the past two years, my work as a QA Automation Engineer at Odrava Health has focused increasingly on CI/CD infrastructure, test environments and build tooling. I'm keen to bring that hands-on experience into a role contributing to reliable cloud infrastructure for connected services.

I own GitLab CI pipelines for three product teams, and improved their average pipeline time from 38 to 14 minutes while reducing monthly runner costs by about 30%. I also built short-lived merge-request environments using Helm on a shared Kubernetes cluster, with automated testing and cleanup. These projects have given me practical experience improving delivery workflows, making systems easier for teams to use, and documenting technical processes; I wrote Odrava's internal guide to how CI works, which is used for onboarding. I also enabled QA and product teams to review merge-request environments before merge and mentored two QA interns, helping teams adopt and use the tooling effectively.

Alongside my professional work, I built a three-node k3s homelab with GitOps deployments, Prometheus, Grafana and Loki, and provisioned a small Hetzner VPS using Terraform. I have also used Linux throughout these projects and have AWS learning experience with EC2 and S3 basics. I also configured Traefik and cert-manager for ingress and TLS certificate management. Together, these projects have given me hands-on experience with infrastructure as code, GitOps delivery, Kubernetes environments, TLS certificate management and platform observability, and I'm continuing to develop toward DevOps and platform engineering.

Corvale's engineering-led approach and the opportunity to help shape infrastructure for a new train fleet particularly appeal to me. I would welcome the chance to discuss how my experience in CI/CD, Kubernetes-based test environments and infrastructure automation could contribute to the Fleet Connectivity team through measurable CI/CD optimisation, automated Kubernetes test environments, infrastructure-as-code learning, and observability-focused engineering.

Thank you for your time.

Marta Kowal-Brandt
