Dear Hiring Team,

I'm applying for the Backend Engineer role on Tessel Cargo Software's Routing & Tracking team. I bring seven years of experience building and operating production backend services, primarily in Java and Spring, with hands-on work in REST APIs, relational databases, Kafka, automated testing, CI/CD, Docker and AWS Kubernetes deployments.

In my current role at Tejo Insurance Tech, I develop and maintain seven Java microservices and designed a versioned, OpenAPI-documented REST API used by 12 broker partners. I also improved the quote endpoint's p99 latency from 1.8 seconds to 450 milliseconds by adding Redis caching and resolving JPA query issues. In the claims workflow, I introduced idempotent Kafka consumers and an outbox table, eliminating duplicate claim records. These experiences align closely with your focus on reliable event ingestion, API performance and dependable production services.

I have also worked with Oracle and PostgreSQL, written integration tests with Testcontainers, and deployed services to AWS EKS using Kubernetes, Helm and Jenkins pipelines. My experience is in Java rather than Python, but Java is among the comparable backend languages listed in your requirements. I'm fluent in English and value clear, practical engineering; Tessel's emphasis on service ownership, concise design notes and sustainable reliability work particularly resonates with the production-focused work I have done.

I would welcome the opportunity to discuss how my backend and production experience could contribute to Tessel's shipment-tracking platform. Thank you for your consideration.

Sincerely,
Daniel Okafor-Reyes
