Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer role on the Routing & Tracking team. I bring seven years of backend development experience, primarily building and operating Java services for insurance and travel products. My work has centered on reliable APIs, event-driven systems, production performance, and maintaining services in live environments—experience that aligns closely with the challenges of your shipment-tracking platform.

At Tejo Insurance Tech, I develop and maintain seven Java 17/Spring Boot microservices and designed the versioned REST API used by 12 broker partners. I also produce and consume Kafka events in claims workflows, where I introduced idempotent consumers and an outbox table to prevent duplicate claim records. To improve API performance, I reduced quote-endpoint p99 latency from 1.8 seconds to 450 milliseconds by adding Redis caching and tuning JPA queries to resolve N+1 query issues. These experiences have given me practical grounding in API design, event-stream processing, and improving reliability through targeted engineering work.

I have also worked with PostgreSQL and other relational databases, automated integration testing, Docker, and AWS cloud deployments. At Viajar Online, I built booking and payment features backed by Oracle and raised payments-module test coverage from 35% to 70% using Testcontainers. In my current role, I work with Docker and deploy services to Kubernetes on AWS EKS using Helm charts and Jenkins CI/CD pipelines and take part in the on-call rota. My professional experience is in Java rather than Python, alongside a backend foundation in REST services, relational data, testing, and production operations that is relevant to the role's comparable-language requirement.

Tessel's focus on dependable services, clear design notes, and engineers owning what they build and operate strongly resonates with the way I approach backend work. I would welcome the opportunity to discuss how my experience designing REST APIs, producing and consuming Kafka events, tuning backend performance, and operating services in production could contribute to the Routing & Tracking team.

Kind regards,
Daniel Okafor-Reyes
