Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. Over the past seven years, I've worked in QA automation, with my recent work focused on CI/CD pipelines, test infrastructure and build tooling. At Odrava Health Software, I own GitLab CI pipelines for three product teams and have built short-lived environments for merge requests using Docker Compose and, later, Helm on a shared Kubernetes cluster. This involved designing the flow from merge-request creation through application, PostgreSQL and seeded-data deployment, automated end-to-end testing and environment removal after merge or 48 hours of inactivity.

I've improved the teams' delivery infrastructure through practical, measurable changes: parallelising test jobs, caching dependencies and separating end-to-end tests reduced average pipeline time from 38 to 14 minutes, while monthly CI runner costs fell by about 30%. I also maintain a roughly 900-test pytest and Playwright suite, with the flaky-test rate reduced from 7% to below 1%, and built dashboards that help teams investigate reliability issues. I own the CI workflow used by approximately 25 developers across three teams and wrote the internal CI guide used in onboarding. By making the pipeline and test environments easier to use, I helped QA and product teams review changes and investigate reliability issues more effectively.

Alongside my professional work, I built a personal three-node Linux k3s cluster with GitOps using Argo CD, Traefik ingress and cert-manager for TLS, with Prometheus, Grafana and Loki for monitoring. I also provisioned a small Hetzner VPS with Terraform. My Terraform and cloud experience is currently centred on a personal Hetzner project and AWS EC2 and S3 learning. I'm currently preparing for the CKA exam; I have not yet earned the certification.

Corvale's plan to connect a new train fleet to its cloud platform is an appealing infrastructure challenge, and your emphasis on teams owning systems end to end aligns with my experience owning CI pipelines and test infrastructure used by three product teams, and with my interest in making systems easier to build, test and operate. I'd welcome the opportunity to discuss how my experience in CI/CD, Kubernetes-based test infrastructure, observability, and developer-facing tooling could contribute to the Fleet Connectivity team.

Kind regards,

Marta Kowal-Brandt
