Dear Corvale Mobility Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. My background is in QA automation and test infrastructure, and over the last two years my work has focused primarily on CI/CD pipelines, deployment tooling, ephemeral Kubernetes environments and infrastructure automation. I'm now seeking to move into a DevOps or platform engineering role, bringing practical experience building and improving CI/CD and test infrastructure that helps product teams deliver and operate software reliably.

At Odrava Health Software, I own GitLab CI pipelines for three product teams, covering build, test and artifact-publishing stages. By parallelising jobs, caching dependencies and reorganising end-to-end testing, I reduced average pipeline time from 38 to 14 minutes and monthly CI runner costs by about 30%. I also built merge-request environments using Docker Compose and later Helm on a shared Kubernetes cluster. Each environment includes the application, PostgreSQL and seeded data, runs end-to-end tests, and is automatically cleaned up after merge or 48 hours of inactivity. I also maintain approximately 900 pytest and Playwright end-to-end tests, reduced flaky-test rates from 7% to below 1%, and built Grafana dashboards backed by PostgreSQL to make reliability issues visible to teams. These environments gave QA and product teams a repeatable way to review features before merge, while the CI documentation I wrote is used for team onboarding.

I've also developed my infrastructure skills through personal projects: a three-node k3s homelab managed with Argo CD, with Prometheus, Grafana and Loki monitoring and cert-manager for TLS, and a Hetzner VPS provisioned with Terraform. My professional Kubernetes work is at namespace level, and my Terraform and AWS experience is from personal learning rather than production cloud operations. My experience investigating issues through logs and databases, improving test reliability, and making technical workflows clearer has strengthened my analytical approach and attention to operability.

Corvale's engineering-led approach and focus on reliable, observable systems appeal to me, and I would value the opportunity to apply my CI/CD, Kubernetes test-environment, monitoring and infrastructure-automation experience to the Fleet Connectivity team. I would welcome the opportunity to discuss how my experience in CI/CD, test environments and infrastructure automation could contribute to the Fleet Connectivity team.

Thank you for your time and consideration.

Marta Kowal-Brandt
