Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on the Shipment Tracking Platform. I have more than three years of professional experience building backend services in Java and Kotlin, and I am interested in bringing that experience to a team working mainly in Python.

At Tejo Insurance Tech, I build and maintain Spring Boot services using Kafka, PostgreSQL and Kubernetes. I have also worked with Docker and AWS services including EKS, S3 and SQS, giving me practical experience supporting cloud-deployed backend services. I designed a versioned OpenAPI 3 REST API for broker quote requests, now serving 12 partners and around 400,000 requests per month. I also addressed duplicate claim creation from at-least-once Kafka delivery with a transactional outbox and idempotency keys; duplicate claims fell from around 40 per week to zero over the following quarter. These projects have strengthened my focus on dependable APIs and event-driven services.

Earlier, at Viajar Online, I worked on booking and payments in a large Java application and raised payments-module test coverage from 35% to 70% using Testcontainers, supporting safer refactoring. I also extracted email and SMS notifications into a separate Spring Boot service using RabbitMQ. In my current role, I participate in a monthly on-call rota and handled a major Kafka lag incident, documenting the response in a write-up that was praised.

Tessel's focus on reliable shipment tracking and its values—"Be dependable. Say what you see. Leave it better."—resonate with the kind of backend work I enjoy. I would welcome the opportunity to bring my experience with APIs, messaging, testing and production reliability to the Routing & Tracking team while developing further in Python.

Thank you for considering my application. I would be glad to discuss how my experience could contribute to the team.

Best regards,
Daniel Okafor-Reyes
