Dear Tessel Cargo Software recruitment team,

I am applying for the Backend Engineer (Python) position on the Routing & Tracking team. I have more than three years of professional experience building and operating backend services in Java and Kotlin, and I am interested in moving toward a Python-based stack. Tessel's focus on dependable shipment tracking and services that handle high volumes of events particularly appeals to me.

At Tejo Insurance Tech, I build and support Spring Boot services, REST APIs and Kafka-based systems. I designed a versioned OpenAPI 3 API for insurance brokers, used by 12 partners handling around 400,000 quote requests per month. I also resolved duplicate claim records caused by at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys; duplicates fell from around 40 per week to zero over the following quarter. These projects have given me practical experience with PostgreSQL, event-driven systems and reliability-focused backend work.

I take part in a monthly on-call week and handled a major Kafka lag incident in March 2024, documenting the response in a write-up that was praised. I have also worked with Docker, AWS services including EKS, S3 and SQS, and automated testing with Testcontainers and Spring Cloud Contract. My Python experience is currently limited to scripts and small Jenkins helpers rather than production services, but I am keen to bring my backend experience to a role focused mainly on Python. I value clear technical communication, and at Tejo I run the backend guild meeting and wrote guidelines for the team's first Kotlin service.

I would welcome the opportunity to discuss how my experience building and operating reliable APIs and event-driven services could contribute to Tessel's shipment-tracking platform. Thank you for considering my application.

Best regards,
Daniel Okafor-Reyes
