Dear Corvale Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity engagement. In my current contract as a Cloud Engineer at Havenstad Logistics, I design Azure landing-zone infrastructure with Terraform and build Azure DevOps pipelines, experience that aligns closely with Corvale's need to take cloud infrastructure from design into production.

At Havenstad, I built a hub-and-spoke network across three subscriptions, including Azure Firewall, private DNS, private endpoints for storage and SQL, and VNet peering. I added Terratest module tests and nightly drift detection. I also replaced manual deployments for 15 .NET and Node applications with YAML pipelines targeting App Service and AKS; most applications moved from roughly monthly deployments to several times per week. I operate AKS upgrades, node pools and ingress, working alongside developers who own the application manifests.

My earlier systems administration work included Windows and Linux servers and a successful migration of 60 VMware servers to Azure IaaS, completed over six weekends without unplanned downtime. Together with my Microsoft 365 security-baseline work using PowerShell, this gives me a practical foundation in infrastructure operations, network design, automation and security. I would bring Azure-focused cloud engineering, Terraform and production delivery experience to Corvale's train-to-cloud platform.

Corvale's work to connect a new train fleet with backend services makes this engagement a strong match for my infrastructure background. I would welcome the opportunity to discuss how I could contribute to designing and operating a reliable, observable and secure platform.

Kind regards,
Samuel Achterberg-Osei
