Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer - Data Platform role. Over nine years in data engineering, I have built and operated production platforms across logistics and payments, with a focus on dependable pipelines, clear data contracts, and reusable systems that analysts can trust.

At Lukovac Freight Hub, I own ingestion and orchestration for a platform using Airflow, dbt, Snowflake, and Kafka. I migrated more than 300 stored procedures into tested dbt models, cutting the nightly warehouse build from 5 hours 10 minutes to 1 hour 50 minutes. I also built a shipment event pipeline processing about 30 million events per day, and introduced CDC with Debezium to reduce load on the production database. These projects reflect the platform ownership and practical engineering improvements described in your role.

My payments experience at Kovalent Pay included PySpark reconciliation jobs on AWS EMR, a dimensional Redshift warehouse for finance and risk, and data quality checks for critical finance tables. I have also introduced data contracts and CI checks, contributed fixes and tests to an open-source Airflow provider, and mentor engineers through regular platform office hours. Halden Pay’s emphasis on ownership and reducing unnecessary complexity aligns with the way I approach data platform work.

My production cloud experience is with AWS, Snowflake, and Redshift, alongside Python, SQL, Airflow, dbt, Docker, and CI/CD. I would welcome the opportunity to discuss how my experience building and improving shared data platforms could contribute to Halden Pay’s Data Platform team.

Kind regards, Lena Varga-Holm lenavh.dev
