Marta Kowal-Brandt

Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor - Fleet Connectivity role. I bring seven years of QA engineering experience and a current focus on CI/CD and test infrastructure, and I am deliberately moving into DevOps and platform engineering. The opportunity to help build infrastructure for Corvale's new train fleet from early design toward production is a strong fit for the direction I am pursuing.

At Odrava Health Software, I own GitLab CI pipelines for three teams and built per-merge-request environments using Docker and Helm on a shared Kubernetes cluster. These environments include application services, PostgreSQL and seeded data, run end-to-end tests, and are automatically removed after merge or 48 hours of inactivity. I reduced average pipeline time from 38 to 14 minutes and monthly CI runner costs by about 30%. I also maintain approximately 900 end-to-end tests and helped reduce the flaky rate from 7% to below 1%. This work has strengthened my practical approach to automation, repeatability and making systems easier for engineering teams to use.

My hands-on infrastructure work so far is concentrated on CI and test environments rather than operating a production cloud platform. The shared Kubernetes cluster is run by a platform team, and my access is at namespace level. In my personal homelab, I run k3s with Argo CD and Prometheus, Grafana and Loki; I have also provisioned a small Hetzner VPS with Terraform. My AWS exposure is personal learning with EC2 and S3, not production experience. I am currently studying for the CKA, with the exam scheduled for January 2027.

I would bring a track record of improving delivery pipelines, building useful environments for developers and documenting technical systems for others. I am interested in applying that foundation to reliable, observable infrastructure for Corvale's fleet connectivity work. I would welcome the opportunity to discuss how my experience could contribute to the team.

Sincerely, Marta Kowal-Brandt
