Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I'm a cloud infrastructure and platform engineer with 10 years of experience in hands-on infrastructure engineering and cloud environment design and operation, including six years running Kubernetes platforms on AWS. I'm drawn to the opportunity to shape cloud infrastructure for Corvale's next generation of trains and take it from system design through to production.

In my current role at Tallybrook, I'm the technical lead for a five-person platform team operating AWS EKS across eight clusters and three regions. I designed and built an internal developer platform adopted by all 14 product teams, bringing new-service delivery to production down from around two weeks to under one day. I've also led technical work across teams, including leading agreement with product leadership on an error-budget policy and introducing SLOs and burn-rate alerts that reduced on-call pages by approximately 60%. This experience has taught me to make infrastructure approachable for developers while keeping reliability and operational ownership central.

My earlier work at Brightwater Games included designing and operating AWS infrastructure in Terraform, using Atlantis for plan and apply workflows, and replacing a noisy Nagios setup with a Prometheus-based observability stack. I also led launch capacity planning and load tests, including a 300,000-concurrent-player test that surfaced a connection-pool limit before launch. Alongside hands-on experience with AWS services including VPC and IAM, this has built a strong foundation in infrastructure design, system reliability, and clear technical decision-making. This strengthened my approach to system design and technical decision-making: use load testing and capacity analysis to challenge assumptions, then build infrastructure that is observable and operationally manageable. Earlier in my career, I managed approximately 600 Linux servers and automated operational work with Bash and Python, giving me a practical foundation in systems operation.

Corvale's engineering-led approach and emphasis on teams owning their systems appeal to me. I would welcome the opportunity to discuss how my experience designing AWS platforms, leading technical work, and helping product teams deploy observable and reliable services could contribute to Corvale's cloud infrastructure.

Best wishes,

Nadia Brennan-Aziz
