Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. The opportunity to help build infrastructure for Corvale's new train fleet is especially compelling because the work connects software delivery with real-world transport systems, and the platform is being shaped from an early stage.

In my current test-infrastructure role, I own GitLab CI pipelines for three product teams and built merge-request environments deployed with Helm to a shared Kubernetes cluster. They bring together an application, PostgreSQL and seeded data, and are automatically removed after merge or 48 hours of inactivity. I also improved pipeline time from 38 to 14 minutes and reduced monthly runner costs by about 30%. These projects have given me practical experience making environments repeatable, supporting teams' delivery workflows and documenting technical processes clearly.

I am extending that experience through a personal k3s and GitOps homelab, where I use Argo CD, Prometheus, Grafana, Loki, Traefik and cert-manager, and provision a small Hetzner VPS with Terraform. My production Kubernetes work is at namespace level, while the platform team operates the shared cluster; my Terraform experience is from personal infrastructure rather than production cloud engineering. I am currently studying for the CKA exam, scheduled for January 2027.

Corvale's focus on telemetry, alerting and reliable train-to-cloud services would let me bring my strengths in automation, observability and practical team support to a consequential infrastructure challenge while continuing to grow as an infrastructure engineer. I would welcome the opportunity to discuss how my experience could contribute to the Fleet Connectivity team.

Kind regards,

Marta Kowal-Brandt
