Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer (Python) role on the Routing & Tracking team. I have nine years of professional experience building production data and event-driven systems, including Python data-processing jobs, internal Python libraries, automation, PostgreSQL data flows, AWS workloads, Kafka pipelines, and on-call operations. The opportunity to help make shipment tracking reliable for freight forwarders is a strong match for the systems I have worked on and the engineering work I enjoy.

At Lukovac Freight Hub, I designed and built a shipment-event pipeline using partner webhooks, Kafka and Snowflake, processing around 30 million events per day with end-to-end latency under two minutes at p95. I also replaced hourly full-table extracts from PostgreSQL with Debezium CDC into Kafka, reducing replica CPU during loads from approximately 70% to 25%. This work required dependable and recoverable event flows, including dead-letter handling and replay tooling so failed events could be reprocessed without data loss. I have applied automated tests and quality checks through dbt tests on 420+ models, JSON Schema validation in CI, GitHub Actions workflows, and tests added to an open-source Airflow provider. These practices helped make data changes safer and more repeatable.

Earlier, at Kovalent Pay, I built Python and PySpark jobs on AWS EMR for transaction reconciliation, designed a Redshift warehouse used by finance and risk, and added data-quality checks to critical tables. In my current role, I take part in a one-week-in-six data-platform on-call rotation and have worked on reliability improvements, including data contracts with CI checks. I would bring practical Python, SQL, PostgreSQL, AWS, Docker and Kafka experience, plus an ownership mindset shaped by operating data systems that other teams rely on.

Tessel's focus on dependable live tracking and pragmatic engineering appeals to me. My experience with replayable event pipelines, data contracts, CI checks, and production on-call work aligns with a team that owns what it runs and improves reliability as part of normal engineering work.

Kind regards,
Lena Varga-Holm
