Dear Hiring Team,

I'm writing to apply for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role at Corvale Mobility. I'm a QA automation engineer with seven years of experience, including the last two focused on CI/CD, test environments and build tooling, and I'm looking to move into DevOps and platform engineering. The opportunity to help shape infrastructure connecting a new train fleet with cloud services is a compelling next step for me.

At Odrava Health Software, I own GitLab CI pipelines supporting three product teams and around 25 developers, from build and test stages through artifact publishing. By parallelising jobs, caching dependencies and moving end-to-end tests to on-demand ephemeral environments, I reduced average pipeline time from 38 to 14 minutes. I also built merge-request test environments with Docker Compose and later Helm charts on a shared Kubernetes cluster. These responsibilities have given me practical experience improving the reliability and day-to-day operation of shared infrastructure, while working across teams.

I bring hands-on experience with Linux, Docker, Helm, basic Kubernetes, Python and Bash, as well as a systems-oriented foundation in computer engineering. I'm particularly interested in Corvale's end-to-end approach to ownership and the chance to contribute to a platform where reliability, observability and secure connectivity matter. My background is strongest in CI/CD and test infrastructure, and I would bring that experience and analytical approach to the team's infrastructure and system-design work.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience could contribute to Corvale's fleet connectivity platform.

Kind regards,

Marta Kowal-Brandt
