Dear Verdane Care team,

I am a third-year Computing student and early-career web developer with hands-on experience building React and TypeScript interfaces, including a four-month software development internship and several academic and freelance projects. I am interested in the Full-Stack Engineer role because it brings together patient-facing features, accessibility, and practical full-stack development.

During my internship, I contributed accessibility fixes to a React news website and built a keyboard- and screen-reader-friendly image gallery for article pages, documenting the component in Storybook and testing it with Jest and React Testing Library. In my final-year project, Tidewatch, I built a React and TypeScript interface alongside a Node.js/Express API and PostgreSQL data storage. I tested the app with NVDA and VoiceOver and achieved a Lighthouse accessibility score of 100. I also built a wellness-oriented yoga studio booking site with Next.js, Tailwind CSS, static generation, and deployment on Vercel. In a separate React and JavaScript group project, I built login screens using Firebase Authentication. These projects have given me experience across frontend development, APIs, SQL data, and Jest and React Testing Library.

Verdane Care's focus on patients, accessibility, and privacy by default particularly appeals to me. I would be keen to contribute my accessibility-minded development experience to software used by patients and care providers, while continuing to develop as a full-stack engineer. I have also supported approximately 30 students in first-year web development lab sessions, an experience that strengthened my ability to explain technical ideas and support others.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience and approach could contribute to the Patient Experience team.

Yours sincerely,

Aiyana Brooks-Tan
