Dear Hiring Manager,

I am writing to apply for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role at Corvale Mobility. My experience designing and operating Azure infrastructure, building Terraform networking modules and automating deployments would be relevant to the work of bringing your train-to-cloud platform into production.

At Havenstad Logistics, I am part of a three-person team operating an Azure estate of approximately 400 VMs and 12 AKS clusters. I build Terraform modules for landing zone networking, including hub-spoke VNets, Azure Firewall, private DNS, private endpoints and cross-subscription peering. I have also implemented module tests in the pipeline and nightly drift detection. These projects have given me practical experience in infrastructure design, networking and security.

I replaced manual deployments for 15 internal applications with Azure DevOps build, test and deployment pipelines targeting App Service or AKS. For most applications, deployment frequency increased from roughly monthly to several times per week. I also operate AKS upgrades, node pools and ingress. Previously, I led the migration of 60 VMware servers to Azure, completing the cutover over six weekends without unplanned downtime.

Corvale's engineering-led approach and the opportunity to shape infrastructure from architecture through to production make this role appealing. I would welcome the opportunity to discuss how my cloud infrastructure and automation experience could support the fleet connectivity team.

Kind regards,
Samuel Achterberg-Osei
