Dear Tessel Cargo Software hiring team,

I'm applying for the Backend Engineer role on your Routing & Tracking team. I have 12 years of professional development experience, with recent work building and operating backend services for customer onboarding. My recent work has focused on production backend services, REST APIs, PostgreSQL, AWS deployment, automated testing and on-call support.

At Älvgrind, I have built services including a BankID verification flow and a secure document-upload service, and contributed to a route-by-route migration from Express to NestJS while keeping the services behind the same API gateway, and later presented that approach at a local JavaScript meetup. These services use Node.js/NestJS, PostgreSQL, AWS ECS, S3, Lambda and SQS, with delivery through GitHub Actions. I participate in a one-week-in-six on-call rotation and have supported production services and improved customer-facing performance, including reducing mobile Largest Contentful Paint from 4.1 seconds to 1.9 seconds. These experiences align well with the role's focus on dependable services, production support and ongoing platform improvement.

My strongest production backend experience is in Node.js and TypeScript, with transferable experience building REST services, working with PostgreSQL, deploying Dockerized services to AWS ECS, and supporting automated delivery through GitHub Actions. I have used Jest and Playwright in production work, and my Python experience is limited to small personal Home Assistant integrations.

Earlier in my career, I was tech lead on a React Native ferry-ticket application that reached approximately 50,000 downloads, giving me relevant transport-domain experience. I also work with Sentry and Datadog for production observability and maintain services that use SQS for asynchronous processing.

Tessel's focus on dependable shipment information and small teams that build and operate their own services connects with my experience supporting production services, participating in a one-week-in-six on-call rotation, and improving an incremental backend migration. I would welcome the opportunity to discuss how my backend and production experience could contribute to the Routing & Tracking platform.

Thank you for your consideration.

Kind regards,

Oskar Haddad-Lindqvist
