Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. Corvale's work connecting a new train fleet to cloud services brings together the infrastructure design and observability that I would bring to the role.

At Tallybrook, I am tech lead for a five-person platform team operating eight EKS clusters across three regions. I built an internal developer platform with service templates, Argo CD and Crossplane self-service for AWS resources. Adopted by all 14 product teams, it reduced the time from a new service to production from around two weeks to under a day. I also introduced SLOs and burn-rate alerts for 20 critical services, agreeing an error-budget policy with product leadership; weekly on-call pages fell by approximately 60%.

Previously, at Brightwater Games, I managed AWS infrastructure with Terraform, building around 40 modules and using Atlantis for pull-request workflows. Across these roles, I have designed and operated AWS cloud environments, with a focus on making services observable and straightforward for product teams to run. I led capacity planning for two major launches, using k6 to simulate 300,000 concurrent players and identify a connection-pool limit before launch. That work reinforced my belief that reliability is mostly about preparation and making the safe path the easy one.

Earlier in my career, I managed approximately 600 Linux servers and automated operational work in Bash and Python.

I would welcome the opportunity to discuss how my hands-on infrastructure engineering experience, AWS cloud environment design and operation, Terraform-based delivery, technical leadership and stakeholder engagement could contribute to Corvale's fleet connectivity platform.

Best wishes,
Nadia Brennan-Aziz
