Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer – Data Platform position. As a test and validation engineer transitioning into data engineering, I am interested in the opportunity to build reusable tools that support analysts and other teams.

At Corvane Automotive Components, I developed Python scripts that process TDMS and CSV output from six test rigs, check results against specifications and generate report figures. The tool reduced report preparation from about three days to half a day per test and is used by four other test engineers. It runs nightly on a lab PC and writes summary results to an IT-created SQL Server staging table. The process runs nightly through Windows Task Scheduler, handles approximately 2 GB of rig data per week, and flags channels outside the test specification before reporting. I also query the test-results database for trend analysis and built a Power BI dashboard used by around 15 validation and design engineers.

My experience so far has been in building and operating internal data-processing tools rather than cloud data platforms. I have nevertheless developed practical foundations relevant to a shared platform: scheduled Python processing, validation of data against defined specifications, SQL Server staging-table outputs, and reusable reporting used by engineering teams. Alongside my work experience, I am completing an online data engineering course and have built a small Flask/SQLite learning project using Git and Docker Compose. I would bring practical experience turning colleagues' reporting needs into reusable tools—four test engineers use the processing tool, and approximately 15 validation and design engineers use the resulting dashboard—alongside the engineering discipline of checking data against specifications. Halden Pay's focus on shared, reusable platforms and collaboration across teams makes this an appealing opportunity to continue that transition.

I would welcome the opportunity to discuss how my test-data automation, data-quality validation, and ongoing data-engineering development could contribute to Halden Pay's shared Data Platform. Thank you for your consideration.

Best regards,
Tiago Ferrão-Lindqvist
