Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and a strong record of designing and building infrastructure that helps product teams deploy and run services reliably. Corvale's engineering-led approach and the opportunity to help shape a new train-to-cloud platform from its early architecture through to production particularly appeal to me.

In my current role as Senior Platform Engineer at Tallybrook, I am technical lead for a five-person team operating an AWS EKS platform across eight clusters, around 350 services and three regions. I built an internal developer platform using service templates, Argo CD GitOps and Crossplane-based self-service provisioning for RDS, SQS and S3, reducing the time for a new service to reach production from around two weeks to under one day. This work has involved turning platform needs into practical infrastructure and supporting developers with services that are easier to deploy and operate.

I also bring hands-on infrastructure-as-code and reliability experience relevant to Corvale's scope. At Brightwater Games, I managed AWS infrastructure through approximately 40 Terraform modules, with Atlantis workflows for plan and apply on pull requests, and supported backend systems serving titles with up to 1.2 million daily active players. Across my roles, I have improved observability, introduced SLOs and error budgets, planned capacity, and contributed to incident response. As incident commander in rotation and technical lead, I am accustomed to taking ownership of technical work and helping teams deliver operationally sound systems.

I would welcome the opportunity to discuss how my AWS platform, Terraform and operational experience could contribute to Corvale's fleet connectivity work and its end-to-end ownership of technology. Thank you for your consideration.

Yours sincerely,
Nadia Brennan-Aziz
