Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. I'm a Senior Platform Engineer and platform team tech lead with hands-on experience designing, building and operating AWS infrastructure, including production EKS platforms. Corvale's need to shape cloud infrastructure from architecture and design through to production is a strong match for my experience designing, building, and operating AWS platforms.

At Tallybrook, I am the technical lead for work across the EKS platform, internal developer platform, service reliability, and infrastructure cost. I designed and built platform capabilities spanning Go and Python service templates, Argo CD ApplicationSets, and Crossplane compositions for AWS services including RDS, SQS and S3. I built a developer platform adopted by all 14 product teams, reducing the time to take a new service to production from about two weeks to under one day. I also established SLOs and burn-rate alerts for 20 critical services, working with product leadership to agree an error-budget policy. This work involved shaping technical approaches, improving how product teams deploy and operate services, and bringing product leadership into reliability decisions.

Earlier, at Brightwater Games, I managed and maintained AWS infrastructure as code with Terraform and Atlantis, maintained observability using Prometheus and Alertmanager, and led launch capacity planning. Load tests simulating 300,000 concurrent players helped us identify and fix a connection-pool limit before launch. I would bring that focus on preparation, clear technical reasoning and operational reliability to Corvale's fleet connectivity platform.

I'd welcome the opportunity to discuss how my experience in cloud infrastructure, Terraform-based AWS operations, system reliability, observability, capacity planning, and technical leadership could contribute to Corvale's work.

Best wishes,

Nadia Brennan-Aziz
