RAFAEL MORETTI-KLEIN

Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer (Python) role. I bring 21 years of backend engineering experience, including hands-on work with Python services and APIs, high-volume event ingestion, and systems where reliability at scale matters. Tessel's work turning carrier events into a dependable live picture of shipments is closely relevant to my experience building fleet-telematics backends that ingested GPS data from 300k vehicles.

At Streamhaus, I was technical lead for the playback API and designed a Go and Cassandra entitlement service that handled 120k requests per second at peak. Later, as Director of Engineering, Platform, I led the migration of a Python 2 monolith to approximately 60 Python and Go services on GKE, helping improve playback API availability from 99.5% to 99.95%. I also introduced company-wide on-call guidelines and architecture reviews. This background aligns with your focus on reliable tracking APIs, event processing, production operations and clear design decisions.

My experience includes Python, PostgreSQL/PostGIS, Kafka, RabbitMQ, Kubernetes, Terraform and observability tools including Prometheus, Grafana and OpenTelemetry. I have also led a route-history product team, bringing relevant experience from transport-related software. Tessel's tracking platform and its focus on dependable services make this a compelling opportunity to contribute my backend and operational experience directly to the product.

I would welcome the opportunity to discuss how my experience could support the Routing & Tracking team. Thank you for considering my application.

Kind regards,
RAFAEL MORETTI-KLEIN
