Dear Hiring Team,

I am applying for the Backend Engineer (Python) role because it brings together hands-on backend engineering, reliable APIs, and the operational ownership of services. I am seeking a senior or staff individual-contributor role, drawing on my earlier production work building services in Go and Python.

At Streamhaus, I designed and wrote most of a Go entitlement service that handled 120k requests per second at peak, with p99 latency under 15 ms. I also worked on the strangler-fig migration of a Python 2 monolith into approximately 60 Python 3 and Go services, setting up a service template with FastAPI or Go, OpenTelemetry, Prometheus, and Terraform. Playback API availability improved from 99.5% to 99.95% during the migration. These experiences are relevant to building and improving dependable backend and tracking APIs.

My most recent role was Director of Engineering for Streamhaus's 45-person platform organisation. In the final two years, my hands-on coding focused on internal tools and cost-dashboard scripts. I built a dashboard using BigQuery billing export and Looker Studio, supporting rightsizing and committed-use discounts that saved EUR 4.2 million per year (31%). My cloud experience is primarily GCP and GKE; my AWS exposure is limited to EC2 and S3.

Tessel's focus on live shipment tracking and services that process carrier events makes this role especially relevant to my API and service-reliability experience. I would welcome the opportunity to discuss how my backend work could contribute to the Routing & Tracking team.

Kind regards,
Rafael Moretti-Klein
