Dear Verdane Care Hiring Team,

I am applying for the Full-Stack Engineer role on the Patient Experience team. I have 12 years of professional development experience, with React and TypeScript as my strongest areas, alongside hands-on work with Node.js, NestJS, PostgreSQL, and AWS. The opportunity to build patient-facing features across the web experience, APIs, and database is a strong match for my background.

At Älvgrind Fintech, I have worked on onboarding features including a Swedish BankID identity step with QR-code and same-device flows. We A/B tested it on 10% of traffic before rollout, and onboarding conversion moved from 61% to 74%. I also worked on a document-upload flow for customer ID documents, using S3 presigned URLs, ClamAV scanning in Lambda, and scan-status updates through SQS into PostgreSQL. These projects have given me practical experience building end-to-end flows that handle sensitive customer information.

Earlier, I was tech lead for a two-developer team building a React Native ferry-ticket app for offline use; I built most of the app, which has approximately 50,000 downloads. I also served as acting team lead for four months in 2024, covering 1:1s and sprint planning. My frontend work is where I am strongest, and I bring substantial experience connecting polished user-facing applications to backend services.

Verdane Care's focus on making care simpler for patients, alongside its commitment to accessibility and privacy, makes this role particularly compelling to me. I would welcome the opportunity to discuss how my React, TypeScript, and NestJS experience could contribute to the Patient Experience squad.

Kind regards,
Oskar
