Dear Hiring Manager,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and a track record of building cloud platforms and operational practices that support reliable services.

At Tallybrook, I am the tech lead for a five-person platform team operating an AWS EKS environment across eight clusters and three regions. I built an internal developer platform using service templates, Argo CD GitOps, and Crossplane-based self-service for RDS, SQS, and S3, helping reduce the time to take a new service to production from approximately two weeks to under one day. I also introduced SLOs and error budgets for critical services and serve in the incident commander rotation.

My previous role at Brightwater Games involved operating AWS backend infrastructure for game titles with up to 1.2 million daily active players. I managed infrastructure as code with Terraform, used Atlantis to run plans and applies through pull requests, and built an observability stack with Prometheus, Grafana, Alertmanager, and Loki. This experience aligns with Corvale's need for an engineer who can build and operate cloud infrastructure, maintain approachable Terraform, and help services remain observable and reliable.

The opportunity to help shape the cloud infrastructure connecting a new train fleet with backend services, from system design through production, is a strong match for my platform and reliability experience. I would welcome the opportunity to discuss how I could contribute to Corvale's Fleet Connectivity work.

Yours sincerely,

Nadia Brennan-Aziz
