Dear Hiring Manager,

I am applying for the Senior Data Engineer – Data Platform role at Halden Pay. I bring 12 years of engineering experience and hands-on use of Python and SQL to turn test-rig data into validated reports and engineering decisions. I am now looking to move into data engineering, and the opportunity to build reusable platform capabilities for analysts, data scientists and product teams is a strong match for the direction I want to take.

In my current role at Corvane Automotive Components, I developed Python scripts using pandas, NumPy and Matplotlib to read test-rig files, check every channel against its specification and generate standard report figures. This reduced report preparation from about three days to half a day per test. I also query a SQL Server test-results database to analyse trends across three product generations. These responsibilities have given me practical experience with data processing, repeatable reporting and data-quality checks, as well as a focus on making results useful to their engineering users.

I also bring a structured approach to investigation and improvement: I correlate test results with FEA, lead 8D root-cause analysis on field failures and have worked across mechanical design, testing and a PLC-controlled test bench. My experience is rooted in engineering data rather than operating a cloud data platform, but it gives me a sound foundation in Python, SQL, quality-focused data handling and collaborative problem-solving that I would bring to Halden Pay's Data Platform team.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience in automating data workflows and supporting engineering decisions could contribute to the team.

Sincerely,
Tiago Ferrão-Lindqvist
