Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer – Data Platform role. In my test and validation work, I have built Python-based tools that turn recurring rig data into checks and reports, and made those tools useful beyond my own tests.

At Corvane Automotive Components, I developed scripts that process TDMS and CSV output from six rigs—about 2 GB each week—flag channels outside test specifications, generate report figures, and write summary results to a SQL Server staging table. The tool runs nightly on a lab PC and is now used by four other test engineers. I also built a Power BI dashboard for pass/fail trends and cycles to failure, used by about 15 colleagues in validation and design. These projects have given me practical experience translating engineering users' needs into reusable data tooling and reporting.

My hands-on data work has been in a test-lab environment, complemented by a personal Flask API project and an online data engineering course, of which I have completed six of nine modules. I would bring to Halden Pay a combination of Python data processing, SQL Server and BI experience, testing discipline, and a track record of creating tools that colleagues can use. The team's focus on shared, reusable platform frameworks is particularly relevant to the internal tooling I have developed.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience could contribute to Halden Pay's Data Platform team.

Best regards,
Tiago Ferrão-Lindqvist
