Tessel Cargo Software
Hiring Team, Routing & Tracking

Application: Backend Engineer (Python) - Shipment Tracking Platform

Dear Hiring Team,

Your Routing & Tracking team's challenge of turning carrier events into reliable live tracking closely matches the backend problems I have worked on: reliable event processing, API performance and production operation. I bring 7 years of backend engineering experience in insurance and travel. My production background is in Java and Spring Boot, matching the comparable-language experience your advertisement welcomes.

At Tejo Insurance Tech, I develop and maintain seven microservices for policy quoting and claims intake. For our Kafka-based claims workflow, I introduced idempotent consumers and an outbox table that eliminated duplicate claim records. I also designed the partner quoting REST API used by 12 broker partners and reduced its quote endpoint p99 latency from 1.8 seconds to 450 milliseconds through Redis caching and JPA query improvements. These are directly relevant foundations for dependable carrier-event ingestion and a responsive public tracking API.

My experience also covers the operational side of backend delivery. I deploy services to AWS EKS using Helm and Jenkins pipelines and take production on-call responsibility one week per month. Previously, at Viajar Online, I wrote Testcontainers integration tests that increased payments module coverage from 35% to 70% and helped extract a Spring Boot notifications service from a monolith. Alongside PostgreSQL, Oracle and Docker skills, this provides a practical foundation for your team's database, automated testing and cloud deployment work.

Tessel's emphasis on clean APIs and engineers owning what they run aligns with my focus on API quality and production reliability. I would welcome a conversation about how my experience with event-driven services, performance tuning and operational responsibility could contribute to Tessel Track.

Kind regards,
Daniel Okafor-Reyes
