Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on your Routing & Tracking team. My production background is in Java and Kotlin, with PostgreSQL, Kafka and Spring Boot, and I am looking to move into a mainly Python stack. Your work turning carrier events into reliable shipment tracking is a close match for the problems I have tackled: keeping event-driven data correct, designing partner-facing APIs and investigating production incidents.

At Tejo Insurance Tech, I addressed duplicate claim records caused by at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys on consumers. Duplicate claims fell from approximately 40 per week to zero over the following quarter. I also designed a versioned REST API with OpenAPI 3, per-partner rate limiting and contract tests, supporting 12 broker partners and approximately 400,000 quote requests per month. These projects offer relevant experience for your event ingestion services and customer-facing tracking API.

Reliability has also been a practical responsibility. I participate in on-call one week per month and handled a major Kafka lag incident in March 2024, producing a write-up that received praise. Previously, at Viajar Online, I increased payments-module test coverage from 35% to 70% using Testcontainers so we could refactor safely. I work in an entirely English-speaking environment, wrote our Kotlin coding guidelines and run our fortnightly backend guild meeting.

My Python experience is currently limited to data-fix scripts and small Jenkins helpers, rather than production services. I would bring established backend engineering experience to the language transition, alongside hands-on work with AWS EKS, S3, SQS and Kubernetes. Tessel's emphasis on engineers running their own services and making time for reliability work aligns with this experience. I would welcome a conversation about how my API and event-processing work could support your tracking platform.

Best regards,

Daniel Okafor-Reyes
