Tessel Cargo Software
Routing & Tracking Hiring Team

Application: Backend Engineer (Python) - Shipment Tracking Platform

Dear Hiring Team,

Your Routing & Tracking team's work connects directly with two areas of my experience: ingesting vehicle-location data and building reliable, high-throughput backend APIs. I am applying for the Backend Engineer (Python) role with 21 years of software engineering experience, including Python services, PostgreSQL/PostGIS and fleet telematics backends processing GPS data from 300k vehicles.

At Nordfels Telematik, I worked with C++, Python, PostgreSQL/PostGIS and RabbitMQ, and led a six-developer team on the route-history product. That experience provides relevant transport-domain context for Tessel's carrier-event ingestion and tracking services. At Streamhaus, I subsequently served as technical lead for the Python playback API and designed a Go entitlement service handling 120k requests per second at peak. These projects offer a concrete foundation for contributing to the performance and reliability of your customer-facing tracking API.

My most recent position was Director of Engineering, Platform, where I drove a migration from a Python 2 monolith to approximately 60 Python/Go services on GKE, with playback API availability improving from 99.5% to 99.95%. Although my responsibilities expanded into organisational leadership, I continued writing code every week, primarily internal tooling in recent years. I also introduced company-wide RFC and on-call guidelines and co-authored the service template and Python style guide during my earlier principal-engineer role. This combination is relevant to Tessel's emphasis on short design notes, service ownership and reliability work. My technical background also includes FastAPI, Kafka, Kubernetes, Terraform, AWS EC2 and S3, and your observability tools: Prometheus, Grafana and OpenTelemetry.

I would welcome a technical conversation about how my telematics and API experience could contribute to Tessel Track, particularly as you extend the event pipeline towards Kafka streams and predictive ETAs. Thank you for considering my application.

Kind regards,
Rafael Moretti-Klein
