Dear Corvale Mobility hiring team,

I am applying for the Cloud Infrastructure / DevOps Contractor - Fleet Connectivity engagement. Your brief combines cloud infrastructure design with responsibility for taking systems into production and keeping them observable and reliable. That is the core of my work: ten years in infrastructure, including six running Kubernetes platforms on AWS, with a focus on making the safe operational path the easy one for backend developers.

At Tallybrook, I am the technical lead of a five-person platform team operating eight EKS clusters across three regions for approximately 350 services. I built an internal developer platform with service templates, Argo CD and Crossplane-based self-service infrastructure, adopted by all 14 product teams. It reduced the time from a new service to production from approximately two weeks to under one day. At Brightwater Games, I managed AWS infrastructure through approximately 40 Terraform modules and Atlantis pull-request workflows. This is directly relevant to maintaining an approachable infrastructure-as-code repository and supporting developers in deploying services that are easy to run.

My reliability work combines technical implementation with agreement on how systems should operate. At Tallybrook, I introduced SLOs and burn-rate alerts for 20 critical services, agreed an error budget policy with product leadership and reduced weekly on-call pages by approximately 60%. At Brightwater, I led capacity planning for two major launches; load tests simulating 300,000 concurrent players exposed a connection pool limit that we fixed before launch. These experiences provide a practical foundation for contributing to system design and challenging decisions with evidence.

Corvale's fleet connectivity scope spans telemetry ingestion, alerting, video streaming and remote content updates. I would bring proven AWS operations, Terraform, Linux and technical leadership to the cloud platform supporting those services. I would welcome a discussion about how that experience could contribute as you shape the architecture and take it to production.

Best wishes,

Nadia Brennan-Aziz
