Dear Corvale Mobility hiring team,

I am applying for the Cloud Infrastructure / DevOps Contractor - Fleet Connectivity engagement. Your scope combines cloud infrastructure design, technical ownership and support for backend developers taking services into production. These are central to my work as Senior Platform Engineer and technical lead at Tallybrook, where I work on the AWS EKS platform, internal developer platform, reliability and cloud costs.

At Tallybrook, I built golden-path service templates and pull-request-based infrastructure provisioning using Terraform, Crossplane and Argo CD. The platform was adopted by all 14 product teams and reduced the time from new service to production from approximately two weeks to under one day. That experience is directly relevant to helping your backend developers deploy services that are straightforward to operate. I also replaced existing node groups with Karpenter and introduced Spot capacity with interruption handling, reducing EC2 spend by 38%, approximately GBP 410,000 annually.

For a platform connecting on-board systems with backend services, observability and preparation matter as much as deployment. I established SLOs and burn-rate alerts for our 20 most critical services, reduced weekly pages by approximately 60% and agreed an error budget policy with product leadership. Previously, at Brightwater Games, I moved AWS infrastructure fully into Terraform with Atlantis and led capacity planning for two major launches. Load tests simulating 300,000 concurrent players exposed a connection pool limit that we fixed before launch. These projects required turning operational risks into concrete engineering decisions and making reliability understandable to stakeholders.

I would bring this combination of hands-on AWS infrastructure work, developer enablement and technical leadership to Corvale's fleet connectivity platform. I would welcome a conversation about how my experience could support your architecture decisions and the path from initial design to production.

Best wishes,

Nadia Brennan-Aziz
