Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. My work has increasingly focused on the infrastructure around software delivery: CI pipelines, Kubernetes-based test environments, and tools that make changes easier to validate and operate. Corvale's work connecting a new train fleet with cloud services is an opportunity to apply that experience to a platform with a clear operational purpose.

At Odrava Health Software, I own GitLab CI pipelines used by three product teams and built merge-request environments deployed with Helm to a shared Kubernetes cluster. I also improved pipeline performance from 38 to 14 minutes, with monthly CI runner costs down about 30%, and created Grafana dashboards that helped teams reduce flaky tests from 7% to below 1%. These projects have involved working across teams and documenting how the CI system works for onboarding.

I have also built a personal three-node k3s homelab with Argo CD, Prometheus, Grafana, Loki, Traefik and cert-manager, and used Terraform to provision infrastructure for a small Hetzner VPS. My Terraform and cloud experience is currently personal rather than production-based; my work Kubernetes access is namespace-level, and the platform team operates the shared cluster. I am preparing for the CKA exam, which is booked for January 2027.

I would bring a practical delivery and automation perspective, experience improving reliability and observability, and a clear understanding of the limits of my current infrastructure scope. I would welcome the opportunity to discuss how that background could contribute to Corvale's fleet-connectivity platform.

Sincerely,
Marta Kowal-Brandt
