Halden Pay
Data Platform Hiring Team

Dear Hiring Team,

I am applying for the Senior Data Engineer - Data Platform position. At Corvane Automotive Components, I built Python tooling that turns test-rig files into checked results, SQL Server summaries and report figures, reducing report preparation from about three days to half a day per test. Halden Pay's emphasis on reusable frameworks rather than one-off pipelines connects directly with this work: the tool now supports four other test engineers, rather than only my own tests.

The scripts process about 2 GB of TDMS and CSV data each week from six rigs, check channels against test specifications and run nightly through Windows Task Scheduler. They write summary results to a staging table created by IT. I also built a Power BI dashboard used by about 15 validation and design engineers to examine pass/fail trends and cycles to failure. This work has given me practical experience translating engineering needs into shared data tools and making specification checks part of routine processing.

My background is in mechanical engineering, and I am making a deliberate transition into data engineering. My experience is with scheduled internal scripts and SQL analysis, not production cloud platforms; I would therefore welcome consideration at a junior or mid-level scope if that better matches your team's needs. I have completed six of nine modules of an online data engineering course and built a local Flask/SQLite learning project using Git and tutorial-based Docker Compose. Alongside that learning, I bring experience investigating failures, delivering measurable improvements and training three apprentices.

I would welcome a conversation about how my Python automation, SQL reporting and experience supporting engineering users could contribute to Halden Pay's Data Platform team. Thank you for considering my application.

Best regards,
Tiago Ferrão-Lindqvist
