Dear Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role on Fleet Connectivity. I bring 10 years of hands-on infrastructure engineering, including six years designing and operating Kubernetes platforms on AWS.

At Tallybrook, I'm technical lead for a five-person team running AWS EKS across eight clusters, 350 services and three regions. I built and operated an internal developer platform using Argo CD GitOps and Crossplane self-service, adopted by all 14 product teams; production onboarding fell from two weeks to under one day. I introduced SLOs and error-budget policies for 20 critical services with product leadership, reducing pages by about 60%, and established incident and post-mortem processes.

At Brightwater Games, I managed AWS cloud infrastructure as code across approximately 40 Terraform modules, replaced Nagios with Prometheus, Grafana, Alertmanager and Loki, and led capacity planning for game backends serving up to 1.2 million daily players. A k6 test simulating 300,000 concurrent players identified a connection-pool limit fixed before launch. I'm interested in applying this experience to Corvale's train-to-cloud platform.

I mentor engineers moving into SRE, have presented on SLOs for product managers, and bring practical experience with Linux systems and AWS IAM.

I'd welcome discussing how my AWS infrastructure design, Terraform, observability and reliability leadership could help take Corvale's connectivity platform from architecture to production.

Best wishes,

Nadia Brennan-Aziz
