Dear Hiring Team,

I am applying for Corvale's Cloud Infrastructure / DevOps Contractor role. I bring AWS platform engineering experience, reliability improvements, and technical leadership from design through production.

At Tallybrook, I tech-lead the platform team running EKS across 3 regions. I built a Terraform, Argo CD, and Crossplane developer platform adopted by all 14 product teams, cutting new-service delivery from about 2 weeks to under 1 day. I introduced SLOs and burn-rate alerts, agreed error-budget policy with product leadership, and reduced weekly on-call pages by about 60%.

At Brightwater Games, I operated AWS backends for titles with up to 1.2 million daily active players, using Terraform and Atlantis and improving observability. k6 load testing and capacity planning prepared launches; I also led Karpenter and Spot migration with interruption handling for stateless workloads, reducing EC2 spend by 38%.

Corvale's vehicle-to-cloud fleet work is a compelling fit for my platform and reliability experience. I would welcome the opportunity to discuss my contribution.

Best wishes,

Nadia Brennan-Aziz
