Dear Hiring Manager,

I am applying for the Backend Engineer role on Tessel Cargo Software's Routing & Tracking team. Turning carrier events into a dependable live picture of shipments, while improving a customer-facing tracking API, is closely aligned with the production backend challenges I have worked on.

The role calls for Python or a comparable backend language; my seven years of production backend experience are in Java, primarily with Spring Boot. At Tejo Insurance Tech, I develop and maintain seven Java 17 microservices, designed a versioned REST API used by 12 broker partners, and improved a claims event workflow using Kafka, idempotent consumers, and an outbox table. I also reduced p99 quote endpoint latency from 1.8 seconds to 450 milliseconds by adding Redis caching and fixing JPA N+1 queries.

Earlier, at Viajar Online, I built booking and payment features, raised payments-module test coverage from 35% to 70% with Testcontainers integration tests, and helped extract a notifications service using Spring Boot and RabbitMQ. I also deploy services to AWS EKS with Helm and Jenkins and participate in an on-call rotation one week per month.

Tessel's emphasis on dependable services, ownership of what the team runs, and dedicated reliability work resonates with my interest in clean APIs and production quality. I would welcome the opportunity to discuss how my experience in event-driven services, API performance, testing, and production operations could contribute to the Routing & Tracking team.

Sincerely,
Daniel Okafor-Reyes
