Dear Corvale Mobility Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. My experience combines hands-on CI/CD and test-infrastructure ownership with practical work designing short-lived application environments, improving observability, and applying systems-architecture principles in personal infrastructure projects. I'm interested in applying that experience to a platform where reliable connections between devices and backend services matter.

At Odrava Health Software, I own GitLab CI pipelines for three product teams, supporting roughly 25 developers. I reduced average pipeline time from 38 to 14 minutes and monthly CI runner costs by about 30% by parallelising jobs, caching dependencies, and restructuring the test stages. I also designed the application-level setup for merge-request environments using Docker Compose and Helm-deployed Kubernetes components, including PostgreSQL, seeded data, automated cleanup, and end-to-end testing. These environments let QA and product stakeholders review features before merge. This work has taught me to make infrastructure practical for the teams that build and operate services, and to communicate technical changes clearly. I also wrote an internal guide to our CI pipelines that is used in onboarding, helping new team members understand how the delivery system works.

I have also designed and operated a personal three-node k3s homelab managed with Argo CD and provisioned a small Hetzner VPS using Terraform, gaining practical experience with infrastructure structure, deployment automation, and service operation. My AWS exposure is through personal learning at the EC2 and S3 fundamentals level rather than professional production use. In my homelab, I use Prometheus, Grafana, and Loki for monitoring, with Traefik ingress and cert-manager for TLS certificate management; at work, I built Grafana dashboards from CI test data. My professional Kubernetes work focuses on namespace-level access and test environments, complemented by hands-on personal infrastructure work; I am preparing for the CKA exam scheduled for January 2027. I would bring a strong foundation in Linux, automation, monitoring, and system-focused problem solving.

Corvale's engineering-led approach and emphasis on teams owning systems end to end appeal to me. I would welcome the opportunity to discuss how my experience with delivery pipelines, test environments, and infrastructure automation could contribute to the Fleet Connectivity team.

Thank you for your consideration.

Marta Kowal-Brandt
