Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring seven years of QA automation and test-infrastructure experience, including ownership of CI/CD pipelines and short-lived test environments for three product teams. I'm interested in applying that experience to a platform where reliable connectivity, observability and end-to-end ownership matter.

At Odrava Health Software, I own GitLab CI pipelines serving approximately 25 developers. By parallelising jobs, caching dependencies and separating end-to-end tests into their own stage, I reduced average pipeline duration from 38 to 14 minutes and monthly CI runner costs by about 30%. I also developed merge-request environments using Helm on the company's shared Kubernetes cluster, with the application, PostgreSQL and seeded data deployed for review and testing, then automatically cleaned up. I designed the workflow around isolated application, PostgreSQL and seeded-data components, and enabled QA and product teams to review features and run end-to-end tests before merge. This work has taught me to build infrastructure that supports product teams while remaining practical to operate.

My infrastructure experience also includes a personal three-node k3s cluster managed through Argo CD, with Prometheus, Grafana and Loki for monitoring, and Terraform used to provision a small Hetzner VPS. I also have basic personal-learning experience with AWS EC2 and S3 and work with Linux systems. My Terraform and cloud experience is from personal projects and learning, rather than production AWS work. In my personal k3s project, I also configured Traefik ingress, cert-manager for TLS, and monitoring with Prometheus, Grafana and Loki. At Odrava, I have namespace-level access to the shared Kubernetes cluster and build Helm charts for test environments. I have also authored a CI guide used in onboarding and mentored two QA interns, experience that has strengthened my technical communication and collaborative approach.

Corvale's work connecting fleet systems with cloud services, and its emphasis on teams taking end-to-end ownership, make this a compelling opportunity. I would welcome the chance to discuss how my experience designing automated deployment and test workflows, improving reliability through measurable analysis, and helping product teams operate those workflows could contribute to Corvale's platform.

Kind regards,
Marta Kowal-Brandt
