Dear Tessel Cargo Software hiring team,

I'm applying for the Backend Engineer (Python) role on the Routing & Tracking team. I bring more than five years of professional backend experience with Java and Kotlin, and I'm keen to apply that foundation in a role working mainly in Python. My Python experience so far is scripting and small Jenkins helpers, rather than production services.

At Tejo Insurance Tech, I build and support Spring Boot services using PostgreSQL, Kafka and Kubernetes on AWS. I designed a versioned OpenAPI 3 quoting API used by 12 broker partners for around 400,000 requests per month, and improved its safeguards with per-partner rate limiting and contract tests. I also resolved duplicate claim records caused by at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys; duplicates fell from around 40 per week to zero over the following quarter.

Reliable production systems and clear communication are important parts of my work. I take part in a monthly on-call rota, handled a major Kafka lag incident, and wrote a follow-up that was praised. Earlier, at Viajar Online, I raised payments-module test coverage from 35% to 70% using Testcontainers and extracted notifications from a Java monolith into a separate Spring Boot service. These experiences align with Tessel's focus on dependable services, ownership and concise technical communication.

I'm interested in bringing my API, event-processing and production-support experience to Tessel's shipment-tracking platform while developing further as a Python backend engineer. Thank you for considering my application. I would welcome the opportunity to discuss how my experience could contribute to the Routing & Tracking team.

Best regards,
Daniel Okafor-Reyes
