Dear Hiring Manager,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. I bring seven years of backend development in Java and Kotlin, with hands-on experience building REST services and Kafka-driven systems where reliability and correctness matter. The challenge of turning high-volume carrier events into a dependable live shipment picture is closely aligned with the production problems I have worked on.

At Tejo Insurance Tech, I designed a versioned OpenAPI 3 quoting API now used by 12 broker partners for around 400,000 requests per month. I also addressed duplicate claim creation from at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys; duplicates fell from around 40 per week to zero over the following quarter. These projects involved PostgreSQL, Kubernetes on EKS, and AWS services, and have given me practical experience with event-driven systems, API design, and operating backend services.

My production service experience is in Java and Kotlin, and I am interested in moving into a Python-focused role. My Python experience so far is scripting for data fixes and small Jenkins helpers, rather than shipped services. I would bring proven backend fundamentals, automated testing experience (including Testcontainers and Spring Cloud Contract), and regular on-call incident response. At Tejo I handled a major Kafka lag incident in March 2024 and wrote an incident account that was praised.

Tessel's focus on live tracking, Kafka event streams, and engineers who own what they run makes this role especially compelling. I would welcome the opportunity to discuss how my API, event-processing, and reliability experience could contribute to the Routing & Tracking team.

Best regards,
Daniel Okafor-Reyes
