Dear Hiring Manager,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. My production backend experience is in Java and Kotlin, and I am keen to bring that experience to a Python-focused role. Across these stacks, I have built REST APIs and event-driven services where correctness and reliability matter.

At Tejo Insurance Tech, I designed a versioned REST API used by 12 broker partners for around 400,000 quote requests per month. I also addressed duplicate claim records from at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys; duplicate records fell from around 40 per week to zero over the following quarter. This work has given me practical experience with PostgreSQL, Kafka, API design, and the reliability challenges of processing event streams.

I also bring hands-on experience with automated testing, Docker, Kubernetes on EKS, and on-call support. At Viajar Online, I raised payments-module test coverage from 35% to 70% with Testcontainers and extracted notifications from a Java monolith into a Spring Boot service using RabbitMQ. I have handled a major Kafka lag incident and written an incident account that was praised. Tessel's focus on dependable shipment tracking and engineers owning the services they run makes this role especially relevant to my experience.

I would welcome the opportunity to discuss how my backend experience could contribute to the Routing & Tracking platform. Thank you for considering my application.

Best regards,
Daniel Okafor-Reyes
