Marta Kowal-Brandt

Dear Corvale Mobility team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. Over the past seven years in QA and test infrastructure, I've increasingly focused on the systems that help product teams build, test and release reliably. I'm now looking to apply that hands-on CI/CD, Kubernetes and infrastructure-automation experience in a DevOps and platform engineering role.

At Odrava Health Software, I own GitLab CI pipelines for three product teams and built short-lived merge-request environments using Docker Compose and Helm on a shared Kubernetes cluster. These environments include the application, PostgreSQL and seeded test data, and are automatically cleaned up after merge or inactivity. This gave QA and product teams a repeatable way to review features before merge and run end-to-end tests, while the automatic cleanup kept the shared environment manageable. By profiling pipelines, parallelising test jobs, caching dependencies and separating end-to-end tests into a dedicated stage, I reduced average pipeline time from 38 to 14 minutes and helped lower monthly CI runner costs by about 30%. This work has involved making infrastructure easier for teams to use, maintain and understand, including writing an internal CI guide used in onboarding and mentoring two QA interns.

Alongside my work experience, I've built a three-node k3s homelab on Linux with GitOps deployments, Prometheus, Grafana and Loki monitoring, and TLS certificates managed with cert-manager. In a personal project, I provisioned a small Hetzner VPS with Terraform; I am also building foundational knowledge of AWS EC2 and S3. I would bring a practical, careful approach to infrastructure work, while continuing to develop my cloud and infrastructure-as-code experience.

Corvale's engineering-led approach and focus on shaping a new train-to-cloud platform make this opportunity especially interesting to me. I'd welcome the chance to discuss how I could contribute practical experience in CI/CD, repeatable test environments, Helm-based Kubernetes deployments, monitoring dashboards and clear technical documentation, while continuing to grow into broader cloud infrastructure ownership.

Thank you for your time and consideration.
