Dear Corvale Mobility Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring seven years of experience in QA automation, with the last two focused primarily on CI/CD pipelines, test environments and build tooling. I'm now moving toward a DevOps or platform engineering role, and the opportunity to help shape infrastructure for connected fleet services is a strong match for that direction.

At Odrava Health Software, I own GitLab CI pipelines used by three product teams and built short-lived merge-request environments using Helm on a shared Kubernetes cluster. These environments include applications, PostgreSQL and seeded data, and are automatically removed after merge or 48 hours of inactivity. I also wrote Bash and Python tooling for PostgreSQL test-data seeding and collected CI test results into PostgreSQL for Grafana dashboards, giving teams better visibility into flaky tests and pipeline quality. I also improved pipeline duration from 38 to 14 minutes while reducing monthly CI runner costs by about 30%, and maintain an end-to-end test suite whose flaky rate is now below 1%. I documented the CI workflow for onboarding, mentored two QA interns, and worked with QA and product teams to make pre-merge environments useful for reviewing changes. This work has involved making delivery workflows more reliable and useful to developers, QA and product teams.

I've also developed my infrastructure skills through personal projects: a three-node k3s cluster with GitOps deployments, Prometheus, Grafana, Loki and cert-manager, as well as Terraform provisioning for a small Hetzner VPS. My Terraform experience comes from provisioning a small Hetzner VPS in a personal project, alongside hands-on work with GitLab CI, Helm-based Kubernetes deployments, Linux, monitoring and TLS certificates.

Corvale's engineering-led approach, with teams owning systems end to end, appeals to me. I could contribute practical experience in delivery automation, ephemeral environments, Kubernetes-based test infrastructure, observability and reliable developer workflows while continuing to grow toward broader cloud infrastructure ownership.

Thank you for your time and consideration.
