Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and hands-on experience designing and running Terraform-managed environments.

At Tallybrook, I'm tech lead for a five-person platform team operating an EKS platform across eight clusters and three regions. I led the development of an internal developer platform adopted by all 14 product teams, reducing the time from a new service to production from around two weeks to under a day. I built an internal developer platform with golden-path service templates, Argo CD GitOps and Crossplane self-service for RDS, SQS and S3; it was adopted by all 14 product teams and reduced the time from a new service to production from around two weeks to under one day. This work required systems architecture and system design decisions across platform and product boundaries, as well as helping developers deploy services that are observable and easy to operate.

Earlier, at Brightwater Games, I managed AWS infrastructure across around 40 Terraform modules and used Atlantis for pull-request plan and apply workflows. My broader infrastructure background includes managing approximately 600 Linux servers and working with AWS services including IAM, EC2, VPC and RDS. I also replaced a noisy Nagios setup with a Prometheus, Grafana, Alertmanager and Loki observability stack, and used k6 load testing to identify and resolve a connection-pool limit before a major launch. That experience strengthened my analytical approach to cloud infrastructure design and operation, capacity planning, reliability and observability—qualities I would bring to Corvale's work taking fleet connectivity infrastructure from design into production.

I'm interested in helping shape cloud infrastructure from system design through production, applying my experience building self-service platforms, defining operational expectations, and supporting developers in deploying services that are observable and easy to operate. I'm also interested in working with backend and infrastructure teams to define clear interfaces, ownership and operational expectations, and to support Corvale's engineering-led approach to systems that teams own end to end. As a tech lead, I have agreed error-budget policies with product leadership, mentored three engineers moving from backend engineering into SRE, and presented on SLOs at a UK DevOps meetup. I would welcome the chance to discuss how my AWS infrastructure, Terraform, platform engineering and reliability experience could contribute to Corvale's fleet connectivity team.

Best wishes,

Nadia Brennan-Aziz
