Dear Tessel Cargo Software recruitment team,

I'm applying for the Backend Engineer (Python) position. I bring seven years of professional experience building and operating backend services in Java and Kotlin, comparable languages named in the role, and I'm keen to move into a backend position focused mainly on Python.

At Viajar Online, I spent over two years working on booking and payments in a Java 11/Spring MVC monolith backed by Oracle. I enjoy the moment when a slow, fragile part of a system becomes predictable. Most visibly, I raised test coverage of the payments module from 35% to 70% using Testcontainers.

I extracted the notifications service from the monolith into its own Spring Boot application.

English has been my professional working language at Tejo Insurance Tech.

Shipment tracking is a new domain for me, but handling partner integrations and event-driven data reliably connects with my work on booking, payments and Kafka-based claims workflows. In my current role, I design versioned REST APIs and run Java/Spring Boot services on Docker and Kubernetes in AWS; I also improved PostgreSQL-backed query performance by fixing JPA N+1 queries, reducing p99 latency from 1.8 seconds to 450 milliseconds. I contribute to CI/CD delivery through Jenkins pipelines, deploying Dockerized services to Kubernetes on AWS EKS.

I participate in a one-week-per-month on-call rotation, and handled a significant Kafka-lag incident that led to a praised write-up. Although my production services have been in Java and Kotlin and my Python experience is currently limited to scripts and Jenkins helpers, I'm keen to apply my backend, API, testing and production-operations experience while moving into a role focused mainly on Python, and I'm excited by the chance to bring my backend and production experience to Tessel Cargo Software's tracking platform.

Thank you for considering my application. I could start after my two-month notice period.

Best regards,
Daniel Okafor-Reyes
