Dear Hiring Manager,

I am writing to apply for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. With seven years of experience building and operating Java backend services, with Java as a comparable backend language used for REST APIs, event-driven integrations and cloud deployments, I would bring experience in event-driven integration, API performance and production reliability to your shipment tracking platform. Tessel's emphasis on dependable services and teams that own what they run aligns with the production-quality work I value.

At Tejo Insurance Tech, I develop and maintain seven Java 17 and Spring Boot microservices for policy quoting and claims intake. I designed a versioned REST API used by 12 broker partners and introduced idempotent Kafka consumers and an outbox table that eliminated duplicate claim records. I also reduced a quote endpoint's p99 latency from 1.8 seconds to 450 milliseconds through Redis caching and JPA query tuning. This experience is directly relevant to building reliable event ingestion and improving the performance of Tessel's tracking API.

I deploy services to AWS EKS using Helm and Jenkins and participate in a production on-call rota. Previously, at Viajar Online, I built booking and payment features backed by Oracle and used Testcontainers to increase payment module test coverage from 35% to 70%. Alongside my experience with PostgreSQL and Oracle relational databases, Docker, AWS cloud deployment, Kubernetes, and Jenkins-based CI/CD, these projects have given me a practical foundation for contributing to Tessel's production systems.

I would welcome the opportunity to discuss how my backend engineering experience could support the Routing & Tracking team. Thank you for your consideration.

Sincerely,
Daniel Okafor-Reyes
