Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role. I bring 21 years of backend engineering experience, including building high-throughput services and APIs, and I am now looking to return to hands-on Python backend engineering. Tessel's focus on dependable shipment tracking and operational reliability is a strong match for the systems I have worked on throughout my career.

At Nordfels Telematik, I built backend systems that ingested GPS data from 300,000 vehicles using Python, C++, PostgreSQL/PostGIS and RabbitMQ, and led six developers on a route-history product. At Streamhaus, I designed and wrote most of a Go entitlement service that handled 120,000 requests per second at peak, and led the technical work on the playback API. These experiences have given me a solid foundation in production backend services, API design, and event-driven ingestion using RabbitMQ that I could bring to your tracking platform.

I have also worked extensively with Python and PostgreSQL, and contributed to a migration from a Python 2 monolith to around 60 Python and Go services. I helped establish service templates with FastAPI or Go, Kubernetes deployment practices, observability with OpenTelemetry and Prometheus, Terraform modules, and have worked with Kafka and RabbitMQ for messaging; I have also used pytest and tox for automated testing. The playback API's availability improved from 99.5% to 99.95%. I would welcome the opportunity to apply this experience to Python services, reliable event ingestion and the continued performance of your tracking API. I value concise technical documentation and clear communication about engineering trade-offs.

Earlier, I built a Python test harness used by QA for eight years and maintained an open-source Python retry library using pytest and tox.

I would be glad to discuss how my backend and fleet-telematics experience could contribute to Tessel's Routing & Tracking team. Thank you for your consideration.

With best regards,
Rafael Moretti-Klein
