Dear Hiring Team,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. I bring 21 years of experience building backend services and APIs, including substantial Python work and production systems that process high volumes of event data. My experience building fleet-telematics systems that ingested GPS data from 300,000 vehicles makes the challenge of turning carrier events into a dependable live tracking picture especially relevant to my background.

At Streamhaus, I led the migration of a Python monolith to around 60 Python and Go services on GKE, helping improve playback API availability from 99.5% to 99.95%. As Principal Engineer, I led work on the Python playback API and designed a Go entitlement service that handled 120,000 requests per second at peak. Earlier, at Nordfels Telematik, I built backend systems using Python, PostgreSQL/PostGIS and RabbitMQ. Earlier, I also built a Python test harness used by QA for eight years. These experiences have given me a strong foundation in API platforms, relational data and distributed systems, as well as practical experience improving the reliability and performance of services in production.

Tessel's focus on service ownership, short design notes and clear technical trade-offs, and dependable tracking systems aligns well with how I have worked: I introduced an RFC process, architecture reviews and on-call guidelines adopted company-wide, and co-authored a Python style guide and service template. I would welcome the opportunity to bring this experience to your tracking API and event-ingestion services, and to contribute to the team's ongoing investment in reliability and observability. My broader platform experience also includes Kafka, Kubernetes, Terraform, and observability tooling including Prometheus, Grafana, and OpenTelemetry.

Thank you for your consideration. I would be glad to discuss how my experience could contribute to Tessel Cargo Software's Routing & Tracking team.

Kind regards,

Rafael Moretti-Klein
