Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on your Routing & Tracking team. My background is in building production backend and platform services in Go and Python, and I am keen to focus my next role on hands-on individual-contributor engineering.

At Streamhaus, I designed and wrote most of a Go entitlement service that handled peak traffic of 120,000 requests per second with p99 latency under 15 ms. I also led the technical side of the playback API and contributed to migrating a Python 2 monolith into approximately 60 Python 3 and Go services. That work included establishing a FastAPI or Go service template with OpenTelemetry, Prometheus and Terraform, and helped improve playback API availability from 99.5% to 99.95%. These experiences have given me a strong foundation in backend service design, production reliability and explaining technical trade-offs.

I have also maintained a Python library using pytest and tox, and built internal Python tooling for service-level cloud-cost visibility. I would bring this experience to developing and improving Tessel's tracking services, while building further depth in the Python and FastAPI stack. Your emphasis on service ownership, concise design notes and sustainable reliability work particularly appeals to me.

I would welcome the opportunity to discuss how my backend and platform experience could contribute to the Routing & Tracking team. Thank you for your consideration.

With best regards,

Rafael Moretti-Klein
